

Zomato Restaurant Data Analysis Report

1. Dataset Overview

This dataset contains information about restaurants listed on Zomato. It includes restaurant details, city, locality, cuisines, average cost for two people, online delivery availability, table booking availability, price range, aggregate rating, rating text, and customer votes.

- Number of rows: 9552
- Number of columns: 22
- Number of unique cities: 142

2. Data Cleaning

The dataset was checked for missing values, duplicate records, and data type issues before analysis.

- Duplicate records found: 0
- The column "Average Cost for two" was converted from str to float64.
- Missing values were found in a small number of columns, mainly Cuisines and a few rating/location-related fields.

Missing values identified:

Column	Missing Values
Cuisines	10
Average Cost for two	2
Rating text	2
Votes	2
Aggregate rating	2
Rating color	2
Price range	2
Locality	1
Has Table booking	1
Currency	1

Longitude	1
Latitude	1
Locality Verbose	1
Switch to order menu	1
Has Online delivery	1
Is delivering now	1

3. Data Analysis

The main numerical columns were summarized to understand the spread of cost, rating, price range, and votes.

Column	count	mean	std	min	25%	50%	75%	max
Average Cost for two	9550.00	1199.33	16122.02	0.00	250.00	400.00	700.00	800000.00
Price range	9550.00	1.80	0.91	1.00	1.00	2.00	2.00	4.00
Aggregate rating	9550.00	2.67	1.52	0.00	2.50	3.20	3.70	4.90
Votes	9550.00	156.92	430.19	0.00	5.00	31.00	131.00	10934.00

Answers to the analysis questions:

- Average restaurant rating: 2.67
- Restaurant with the highest number of votes: Toit in Bangalore, with 10934 votes.
- Average cost for two across all restaurants: 1199.33
- Average rating for restaurants with Online Delivery: 3.249
- Average rating for restaurants without Online Delivery: 2.465
- Average rating for restaurants with Table Booking: 3.442
- Average rating for restaurants without Table Booking: 2.559
- City with the highest number of restaurants: New Delhi (5473 restaurants).
- Most frequent cuisine: North Indian (3960 occurrences).

Top 10 cities with the highest number of restaurants:

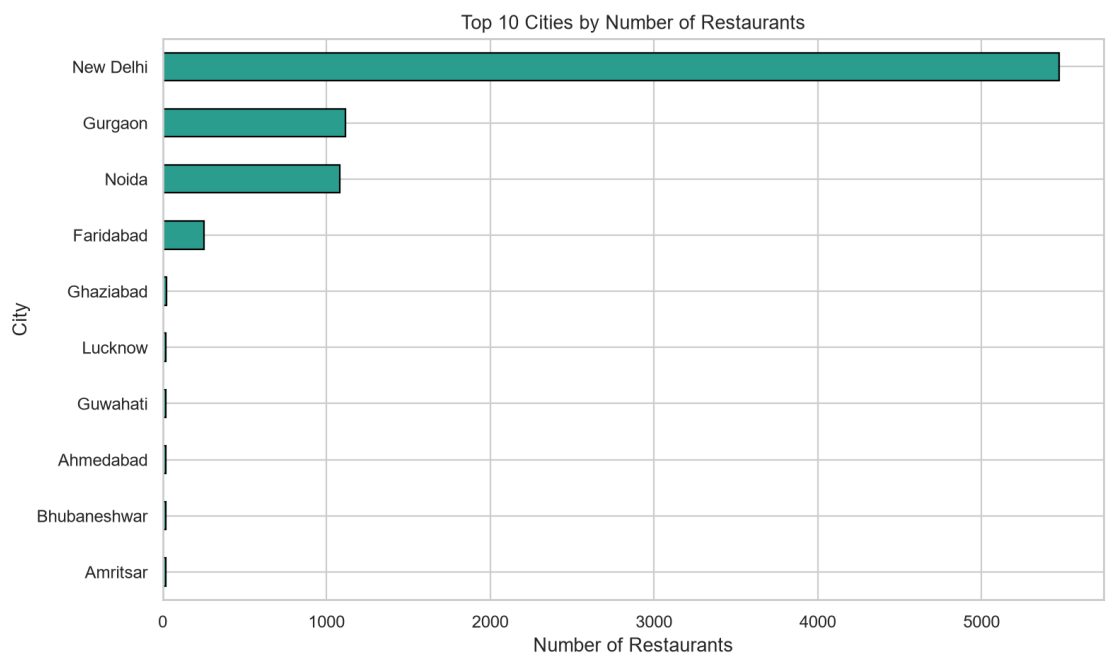

City	Restaurant Count
New Delhi	5473
Gurgaon	1118
Noida	1080
Faridabad	251
Ghaziabad	25
Ahmedabad	21
Amritsar	21
Bhubaneshwar	21
Guwahati	21
Lucknow	21

Key observations:

- New Delhi has the largest restaurant presence by a very wide margin.
- North Indian cuisine appears most often in the dataset.
- Restaurants with Online Delivery and Table Booking have higher average ratings than restaurants without these services.
- Higher price ranges generally show better average ratings, which may point to stronger customer experience in premium categories.

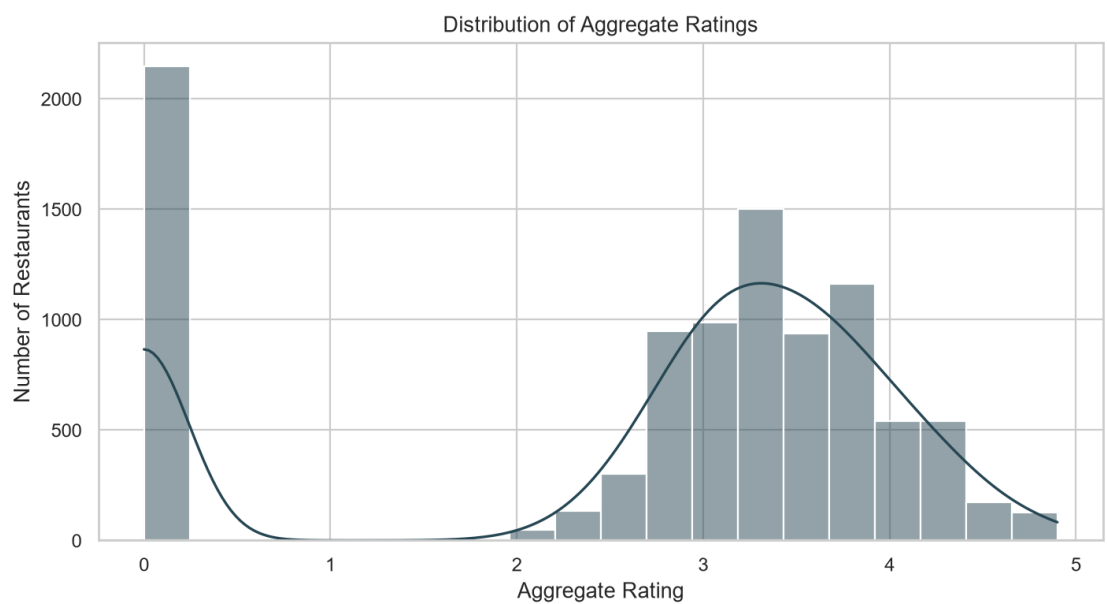

4. Data Visualizations

Top 10 cities with the highest number of restaurants

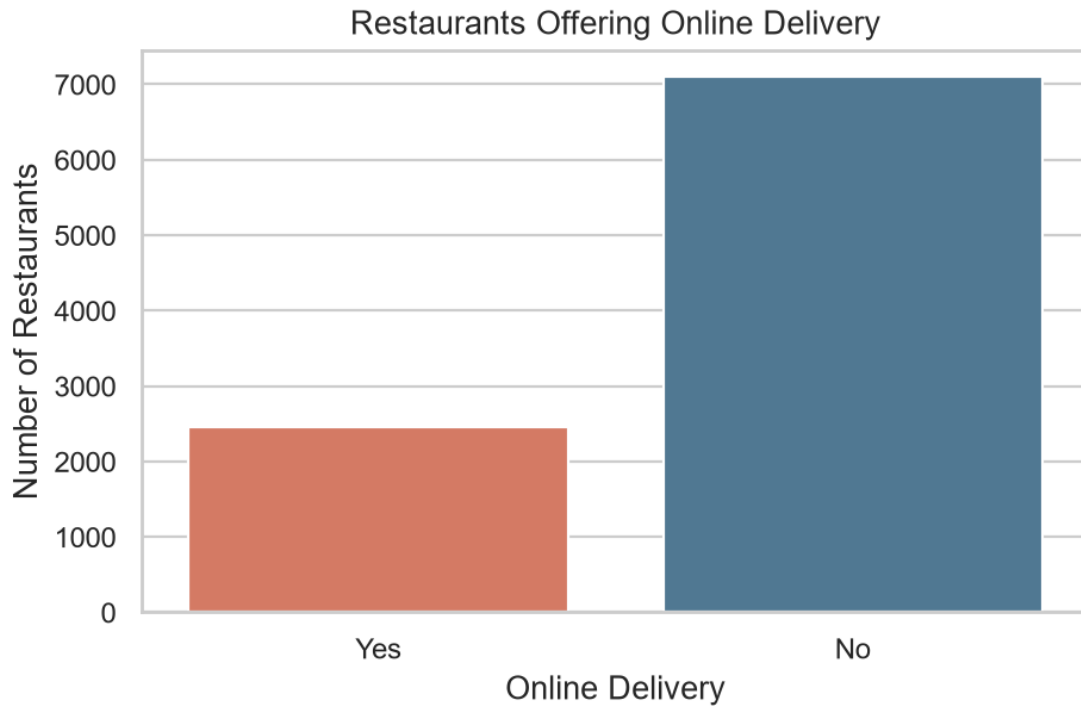

This chart shows that restaurant listings are strongly concentrated in New Delhi, followed by Gurgaon and Noida. It suggests that restaurant competition and customer choice are much higher in these large urban markets.

Distribution of Aggregate Ratings

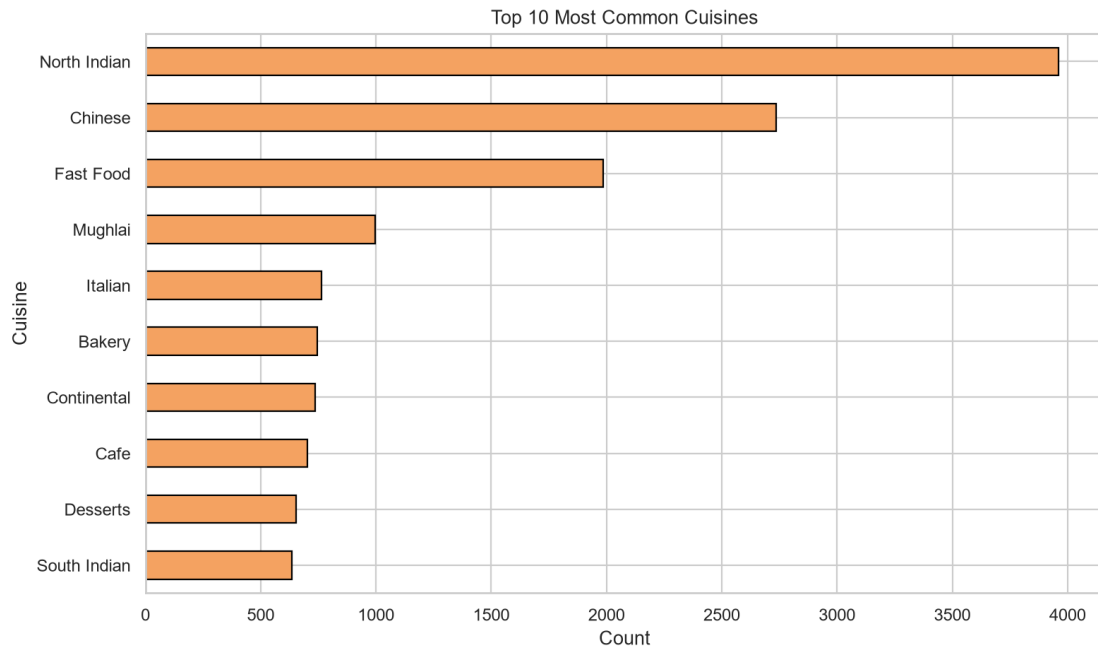

Most ratings are concentrated in the middle range, while fewer restaurants have very high ratings. The visible count near zero suggests that some restaurants may be unrated or have very low rating values.

Restaurants offering Online Delivery

More restaurants do not offer online delivery than those that do. This shows that many restaurants in the dataset may still depend mainly on dine-in or offline ordering.

Top 10 most common cuisines

North Indian is the most common cuisine, followed by popular categories such as Chinese and Fast Food. This shows a clear preference pattern in the restaurant market.

Average rating by Price Range

Average ratings rise as price range increases. This suggests that higher-priced restaurants may provide better service, ambience, or overall customer experience.

5. Conclusion

Overall, the analysis shows that restaurant activity is highly concentrated in a few major cities, especially New Delhi. North Indian cuisine is the most popular cuisine in the dataset, which suggests strong demand and strong competition in that category.

The data also shows that restaurants with Online Delivery and Table Booking generally receive better average ratings. This may mean that convenience, service options, and customer experience play an important role in restaurant performance.

Business observations from the dataset:

- Restaurants in high-density cities may need stronger differentiation because competition is high.
- Popular cuisine categories can attract demand, but they may also face heavy competition.
- Adding service features such as online delivery and table booking may help improve customer convenience and ratings.
- Premium restaurants tend to have higher ratings, so quality of experience appears to matter to customers.
